

# Package: hsstan (via r-universe)

October 26, 2024

**Type** Package

**Title** Hierarchical Shrinkage Stan Models for Biomarker Selection

**Version** 0.8.2.9000

**Date** 2024-01-13

**Description** Linear and logistic regression models penalized with hierarchical shrinkage priors for selection of biomarkers (or more general variable selection), which can be fitted using Stan (Carpenter et al. (2017) <[doi:10.18637/jss.v076.i01](https://doi.org/10.18637/jss.v076.i01)>). It implements the horseshoe and regularized horseshoe priors (Piironen and Vehtari (2017) <[doi:10.1214/17-EJS1337SI](https://doi.org/10.1214/17-EJS1337SI)>), as well as the projection predictive selection approach to recover a sparse set of predictive biomarkers (Piironen, Paasiniemi and Vehtari (2020) <[doi:10.1214/20-EJS1711](https://doi.org/10.1214/20-EJS1711)>).

hsstan-package	<i>Hierarchical shrinkage Stan models for biomarker selection</i>
----------------	---

---

## Description

The **hsstan** package provides linear and logistic regression models penalized with hierarchical shrinkage priors for selection of biomarkers. Models are fitted with Stan (Carpenter et al. (2017)), which allows to perform full Bayesian inference.

## Details

The package implements the horseshoe and regularized horseshoe priors (Piironen and Vehtari (2017)), and the projection predictive selection approach to recover a sparse set of predictive biomarkers (Piironen, Paasiniemi and Vehtari (2020)).

The approach is particularly suited to selection from high-dimensional panels of biomarkers, such as those that can be measured by MSMS or similar technologies (Colombo, Valo, McGurnaghan et al. (2019), Colombo, McGurnaghan, Blackburn et al. (2020)).

---

 bayes\_R2.hsstan

*Bayesian and LOO-adjusted R-squared*

---

## Description

Compute the Bayesian and the LOO-adjusted R-squared from the posterior samples. For Bayesian R-squared it uses the modelled residual variance (rather than the variance of the posterior distribution of the residuals). The LOO-adjusted R-squared uses Pareto smoothed importance sampling LOO residuals and Bayesian bootstrap.

## Usage

```
## S3 method for class 'hsstan'
bayes_R2(object, prob = 0.95, summary = TRUE, ...)

## S3 method for class 'hsstan'
loo_R2(object, prob = 0.95, summary = TRUE, ...)
```

## Arguments

object	An object of class hsstan.
prob	Width of the posterior interval (0.95, by default). It is ignored if summary=FALSE.
summary	Whether a summary of the distribution of the R-squared should be returned rather than the pointwise values (TRUE by default).
...	Currently ignored.

**Value**

The mean, standard deviation and posterior interval of R-squared if `summary=TRUE`, or a vector of R-squared values with length equal to the size of the posterior sample if `summary=FALSE`.

**Examples**

```
# continued from ?hsstan
bayes_R2(hs.biom)
loo_R2(hs.biom)
```

---

diabetes

*Diabetes data with interaction terms*

---

**Description**

The dataset consists of observations on 442 individuals for which a quantitative measure of diabetes progression is recorded in variable  $Y$ . Predictors include 10 baseline measurements, 45 interactions and 9 quadratic terms, for a total of 64 variables for each individual. Each variable has been standardized by subtracting the mean and then dividing it by its standard deviation.

**Format**

A data frame with 442 rows and 65 columns (centred and scaled).

**Source**

B. Efron, T. Hastie, I. Johnstone and R. Tibshirani (2004), Least angle regression, *The Annals of Statistics*, 32 (2), 407-499. doi:[10.1214/009053604000000067](https://doi.org/10.1214/009053604000000067)

The original dataset is available from <https://web.stanford.edu/~hastie/Papers/LARS/data64.txt>

**Examples**

```
data(diabetes, package="hsstan")
```

---

hsstan

*Hierarchical shrinkage models*

---

## Description

Run the No-U-Turn Sampler (NUTS) as implemented in Stan to fit a hierarchical shrinkage model.

## Usage

```
hsstan(
  x,
  covs.model,
  penalized = NULL,
  family = gaussian,
  iter = 2000,
  warmup = floor(iter/2),
  scale.u = 2,
  regularized = TRUE,
  nu = ifelse(regularized, 1, 3),
  par.ratio = 0.05,
  global.df = 1,
  slab.scale = 2,
  slab.df = 4,
  qr = TRUE,
  seed = 123,
  adapt.delta = NULL,
  keep.hs.pars = FALSE,
  ...
)
```

## Arguments

x	Data frame containing outcome, covariates and penalized predictors. Continuous predictors and outcome variable should be standardized before fitting the models as priors assume them to have mean zero and unit variance.
covs.model	Formula containing the unpenalized covariates.
penalized	Names of the variables to be used as penalized predictors. Any variable that is already part of the covs.model formula will be penalized. If NULL or an empty vector, a model with only unpenalized covariates is fitted.
family	Type of model fitted: either <code>gaussian()</code> for linear regression (default) or <code>binomial()</code> for logistic regression.
iter	Total number of iterations in each chain, including warmup (2000 by default).
warmup	Number of warmup iterations per chain (by default, half the total number of iterations).
scale.u	Prior scale (standard deviation) for the unpenalized covariates.

<code>regularized</code>	If TRUE (default), the regularized horseshoe prior is used as opposed to the original horseshoe prior.
<code>nu</code>	Number of degrees of freedom of the half-Student-t prior on the local shrinkage parameters (by default, 1 if <code>regularized=TRUE</code> and 3 otherwise).
<code>par.ratio</code>	Expected ratio of non-zero to zero coefficients (ignored if <code>regularized=FALSE</code> ). The scale of the global shrinkage parameter corresponds to <code>par.ratio</code> divided by the square root of the number of observations; for linear regression only, it's further multiplied by the residual standard deviation <code>sigma</code> .
<code>global.df</code>	Number of degrees of freedom for the global shrinkage parameter (ignored if <code>regularized=FALSE</code> ). Larger values induce more shrinkage.
<code>slab.scale</code>	Scale of the regularization parameter (ignored if <code>regularized=FALSE</code> ).
<code>slab.df</code>	Number of degrees of freedom of the regularization parameter (ignored if <code>regularized=FALSE</code> ).
<code>qr</code>	Whether the thin QR decomposition should be used to decorrelate the predictors (TRUE by default). This is silently set to FALSE if there are more predictors than observations.
<code>seed</code>	Optional integer defining the seed for the pseudo-random number generator.
<code>adapt.delta</code>	Target average proposal acceptance probability for adaptation, a value between 0.8 and 1 (excluded). If unspecified, it's set to 0.99 for hierarchical shrinkage models and to 0.95 for base models.
<code>keep.hs.pars</code>	Whether the parameters for the horseshoe prior should be kept in the <code>stanfit</code> object returned (FALSE by default).
<code>...</code>	Further arguments passed to <code>rstan::sampling()</code> , such as <code>chains</code> (4 by default), <code>cores</code> (the value of <code>options("mc.cores")</code> by default), <code>refresh</code> ( <code>iter / 10</code> by default).

## Value

An object of class `hsstan` containing the following fields:

<code>stanfit</code>	an object of class <code>stanfit</code> containing the output produced by Stan, including posterior samples and diagnostic summaries. It can be manipulated using methods from the <b>rstan</b> package.
<code>betas</code>	posterior means of the unpenalized and penalized regression parameters.
<code>call</code>	the matched call.
<code>data</code>	the dataset used in fitting the model.
<code>model.terms</code>	a list of names for the outcome variable, the unpenalized covariates and the penalized predictors.
<code>family</code>	the family object used.
<code>hsstan.settings</code>	the optional settings used in the model.

## See Also

[kfold\(\)](#) for cross-validating a fitted object.

**Examples**

```
data(diabetes)

# non-default settings for speed of the example
df <- diabetes[1:50, ]
hs.biom <- hsstan(df, Y ~ age + sex, penalized=colnames(df)[5:10],
                 chains=2, iter=250)
```

---

kfold.hsstan	<i>K-fold cross-validation</i>
--------------	--------------------------------

---

**Description**

Perform K-fold cross-validation using the same settings used when fitting the model on the whole data.

**Usage**

```
## S3 method for class 'hsstan'
kfold(
  x,
  folds,
  chains = 1,
  store.fits = TRUE,
  cores = getOption("mc.cores", 1),
  ...
)
```

**Arguments**

x	An object of class hsstan.
folds	Integer vector with one element per observation indicating the cross-validation fold in which the observation should be withdrawn.
chains	Number of Markov chains to run. By default this is set to 1, independently of the number of chains used for x.
store.fits	Whether the fitted models for each fold should be stored in the returned object (TRUE by default).
cores	Number of cores to use for parallelization (the value of options("mc.cores") by default). The cross-validation folds will be distributed to the available cores, and the Markov chains for each model will be run sequentially.
...	Further arguments passed to <code>rstan::sampling()</code> .

**Value**

An object with classes `kfold` and `loo` that has a similar structure as the objects returned by `loo()` and `waic()` and is compatible with the `loo_compare` function for comparing models. The object contains the following fields:

<code>estimates</code>	a matrix containing point estimates and standard errors of the expected log pointwise predictive density (" <code>elpd_kfold</code> "), the effective number of parameters (" <code>p_kfold</code> ", always NA) and the K-fold information criterion " <code>kfoldic</code> " (which is $-2 * \text{elpd\_kfold}$ , i.e., converted to the deviance scale).
<code>pointwise</code>	a matrix containing the pointwise contributions of " <code>elpd_kfold</code> ", " <code>p_kfold</code> " and " <code>kfoldic</code> ".
<code>fits</code>	a matrix with two columns and number of rows equal to the number of cross-validation folds. Column <code>fit</code> contains the fitted <code>hsstan</code> objects for each fold, and column <code>test.idx</code> contains the indices of the withdrawn observations for each fold. This is not present if <code>store.fits=FALSE</code> .
<code>data</code>	the dataset used in fitting the model (before withdrawing observations). This is not present if <code>store.fits=FALSE</code> .

**Examples**

```
# continued from ?hsstan
# only 2 folds for speed of example
folds <- rep(1:2, length.out=length(df$Y))
cv.biom <- kfold(hs.biom, folds=folds, cores=2)
```

---

<code>log_lik.hsstan</code>	<i>Pointwise log-likelihood</i>
-----------------------------	---------------------------------

---

**Description**

Compute the pointwise log-likelihood.

**Usage**

```
## S3 method for class 'hsstan'
log_lik(object, newdata = NULL, ...)
```

**Arguments**

<code>object</code>	An object of class <code>hsstan</code> .
<code>newdata</code>	Optional data frame to use to evaluate the log-likelihood. If NULL (default), the model matrix is used.
<code>...</code>	Currently ignored.

**Value**

A matrix of size  $S$  by  $N$ , where  $S$  is number of draws from the posterior distribution, and  $N$  is the number of data points.

**Examples**

```
# continued from ?hsstan
log_lik(hs.biom)
```

---

loo.hsstan	<i>Predictive information criteria for Bayesian models</i>
------------	--

---

**Description**

Compute an efficient approximate leave-one-out cross-validation using Pareto smoothed importance sampling (PSIS-LOO), or the widely applicable information criterion (WAIC), also known as the Watanabe-Akaike information criterion.

**Usage**

```
## S3 method for class 'hsstan'
loo(x, cores = getOption("mc.cores"), ...)

## S3 method for class 'hsstan'
waic(x, cores = getOption("mc.cores"), ...)
```

**Arguments**

x	An object of class <code>hsstan</code> .
cores	Number of cores used for parallelisation (the value of <code>options("mc.cores")</code> by default).
...	Currently ignored.

**Value**

A loo object.

**Examples**

```
# continued from ?hsstan
loo(hs.biom)
waic(hs.biom)
```

---

nsamples.hsstan	<i>Number of posterior samples</i>
-----------------	------------------------------------

---

**Description**

Extracts the number of posterior samples stored in a fitted model.

**Usage**

```
## S3 method for class 'hsstan'
nsamples(object, ...)
```

**Arguments**

object	An object of class hsstan.
...	Currently ignored.

**Value**

The total number of posterior samples across the chains after discarding the warmup iterations.

**Examples**

```
# continued from ?hsstan
nsamples(hs.biom)
```

---

plot.projsel	<i>Plot of relative explanatory power of predictors</i>
--------------	---

---

**Description**

The function plots the relative explanatory power of each predictor in order of selection. The relative explanatory power of predictors is computed according to the KL divergence from the full model to each submodel, scaled in such a way that the baseline model (either the null model or the model containing only unpenalized covariates) is at 0, while the full model is at 1.

**Usage**

```
## S3 method for class 'projsel'
plot(
  x,
  title = NULL,
  max.points = NULL,
  max.labels = NULL,
  from.covariates = TRUE,
```

```

    font.size = 12,
    hadj = 0.05,
    vadj = 0,
    ...
  )

```

### Arguments

<code>x</code>	A data frame created by <code>projssel()</code> .
<code>title</code>	Title of the plot. If NULL, no title is displayed.
<code>max.points</code>	Maximum number of predictors to be plotted. If NULL (default) or 0, all points are plotted.
<code>max.labels</code>	Maximum number of predictors to be labelled. If NULL (default), all predictor labels present in <code>x</code> are displayed, which may result in overprinting.
<code>from.covariates</code>	Whether the plotting should start from the unpenalized covariates (TRUE by default). If set to FALSE, the plot includes a point for the null (intercept-only) model.
<code>font.size</code>	Size of the textual elements (labels and axes).
<code>hadj, vadj</code>	Horizontal and vertical adjustment for the labels.
<code>...</code>	Currently ignored.

### Value

A **ggplot2** object showing the relative incremental contribution of each predictor starting from the initial set of unpenalized covariates.

---

```
posterior_interval.hsstan
```

*Posterior uncertainty intervals*

---

### Description

Compute posterior uncertainty intervals for `hsstan` objects.

### Usage

```

## S3 method for class 'hsstan'
posterior_interval(object, pars = NULL, prob = 0.95, ...)

```

**Arguments**

object	An object of class hsstan.
pars	Names of parameters for which posterior intervals should be returned, which can be specified as regular expressions. If NULL (default) then this refers to the set of predictors used in the model.
prob	A value between 0 and 1 indicating the desired probability to be covered by the uncertainty intervals (0.95, by default).
...	Currently ignored.

**Value**

A matrix with lower and upper interval bounds as columns and as many rows as selected parameters.

**Examples**

```
# continued from ?hsstan
posterior_interval(hs.biom)
```

---

```
posterior_linpred.hsstan
```

*Posterior distribution of the linear predictor*

---

**Description**

Extract the posterior draws of the linear predictor, possibly transformed by the inverse-link function.

**Usage**

```
## S3 method for class 'hsstan'
posterior_linpred(object, transform = FALSE, newdata = NULL, ...)
```

**Arguments**

object	An object of class hsstan.
transform	Whether the linear predictor should be transformed using the inverse-link function (FALSE by default).
newdata	Optional data frame containing the variables to use to predict. If NULL (default), the model matrix is used. If specified, its continuous variables should be standardized, since the model coefficients are learnt on standardized data.
...	Currently ignored.

**Value**

A matrix of size  $S$  by  $N$ , where  $S$  is the number of draws from the posterior distribution of the (transformed) linear predictor, and  $N$  is the number of data points.

**Examples**

```
# continued from ?hsstan
posterior_linpred(hs.biom)
```

---

posterior\_performance *Posterior measures of performance*

---

**Description**

Compute the log-likelihood and a relevant measure of performance (R-squared or AUC) from the posterior samples.

**Usage**

```
posterior_performance(
  obj,
  prob = 0.95,
  sub.idx = NULL,
  summary = TRUE,
  cores = getOption("mc.cores", 1)
)
```

**Arguments**

obj	An object of class <code>hsstan</code> or <code>kfold</code> .
prob	Width of the posterior interval (0.95, by default). It is ignored if <code>summary=FALSE</code> .
sub.idx	Vector of indices of observations in the dataset to be used in computing the performance measures. If <code>NULL</code> (default), all observations in the dataset are used.
summary	Whether a summary of the distribution of the performance measure should be returned rather than the pointwise values ( <code>TRUE</code> by default).
cores	Number of cores to use for parallelization (the value of <code>options("mc.cores")</code> by default).

**Value**

The mean, standard deviation and posterior interval of the performance measure (R-squared or AUC) if `summary=TRUE`, or a vector of values of the performance measure with length equal to the size of the posterior sample if `summary=FALSE`. Attribute `type` reports whether the performance measures are cross-validated or not. If `sub.idx` is not `NULL`, attribute `subset` reports the index of observations used in the computations.

**Examples**

```
# continued from ?hsstan
posterior_performance(hs.biom, cores=1)
```

---

```
posterior_predict.hsstan
      Posterior predictive distribution
```

---

**Description**

Draw from the posterior predictive distribution of the outcome.

**Usage**

```
## S3 method for class 'hsstan'
posterior_predict(object, newdata = NULL, nsamples = NULL, seed = NULL, ...)
```

**Arguments**

object	An object of class hsstan.
newdata	Optional data frame containing the variables to use to predict. If NULL (default), the model matrix is used. If specified, its continuous variables should be standardized, since the model coefficients are learnt on standardized data.
nsamples	A positive integer indicating the number of posterior samples to use. If NULL (default) all samples are used.
seed	Optional integer defining the seed for the pseudo-random number generator.
...	Currently ignored.

**Value**

A matrix of size S by N, where S is the number of simulations from the posterior predictive distribution, and N is the number of data points.

**Examples**

```
# continued from ?hsstan
posterior_predict(hs.biom)
```

---

posterior_summary	<i>Posterior summary</i>
-------------------	--------------------------

---

## Description

Produce a summary of the posterior samples for the quantities of interest.

## Usage

```
posterior_summary(x, prob, ...)  
  
## Default S3 method:  
posterior_summary(x, prob = 0.95, ...)  
  
## S3 method for class 'hsstan'  
posterior_summary(x, prob = 0.95, pars = NULL, ...)
```

## Arguments

x	An object containing or representing posterior samples. If x is a matrix, it should have size S by Q, where S is the number of posterior samples, and Q is the number of quantities of interest.
prob	Width of the posterior intervals (0.95, by default).
...	Further arguments passed to or from other methods.
pars	Vector of parameter names to be extracted. If NULL (default) then this refers to the set of predictors used in the model.

## Value

A matrix with columns containing mean, standard deviation and posterior intervals for the given quantities.

## See Also

[summary\(\)](#) to produce summaries of hsstan objects that include the number of effective samples and the split-Rhat diagnostic.

## Examples

```
# continued from ?hsstan  
posterior_summary(hs.biom)
```

---

print.hsstan	<i>Print a summary for the fitted model</i>
--------------	---

---

**Description**

Print a summary for the fitted model

**Usage**

```
## S3 method for class 'hsstan'
print(x, ...)
```

**Arguments**

x	An object of class hsstan.
...	Further arguments to <a href="#">summary()</a> .

---

projssel	<i>Forward selection minimizing KL-divergence in projection</i>
----------	---

---

**Description**

Forward selection minimizing KL-divergence in projection

**Usage**

```
projssel(obj, max.iters = 30, start.from = NULL, out.csv = NULL)
```

**Arguments**

obj	Object of class hsstan.
max.iters	Maximum number of iterations (number of predictors selected) after which the selection procedure should stop.
start.from	Vector of variable names to be used in the starting submodel. If NULL (default), selection starts from the set of unpenalized covariates if the model contains penalized predictors, otherwise selection starts from the intercept-only model.
out.csv	If not NULL, the name of a CSV file to save the output to.

**Value**

A data frame of class `projssel` where each row corresponds to a forward-selected submodel that contains all variables listed up to that row. Attribute `start.from` reports the predictors in the initial model. The data frame contains the following columns:

<code>var</code>	names of the variables selected.
<code>kl</code>	KL-divergence from the full model to the submodel.
<code>rel.kl.null</code>	relative explanatory power of predictors starting from the intercept-only model.
<code>rel.kl</code>	relative explanatory power of predictors starting from the initial submodel.
<code>elpd</code>	the expected log predictive density of the submodels.
<code>delta.elpd</code>	the difference in <code>elpd</code> from the full model.

**Examples**

```
# continued from ?hsstan
sel <- projssel(hs.biom, max.iters=3)
plot(sel)
```

---

`sampler.stats`

*Sampler statistics*

---

**Description**

Report statistics on the parameters used in the sampler, the sampler behaviour and the sampling time.

**Usage**

```
sampler.stats(object)
```

**Arguments**

`object` An object of class `hsstan`.

**Value**

A matrix with  $C + 1$  rows, where  $C$  is the number of Markov chains, reporting average acceptance probability, average stepsize, number of divergent transitions, maximum tree depth, total number of gradient evaluations, warmup and sampling times in seconds.

**Examples**

```
# continued from ?hsstan
sampler.stats(hs.biom)
```

---

summary.hsstan	<i>Summary for the fitted model</i>
----------------	-------------------------------------

---

**Description**

Summary for the fitted model

**Usage**

```
## S3 method for class 'hsstan'
summary(
  object,
  pars = NULL,
  prob = 0.95,
  digits = 2,
  sort = NULL,
  decreasing = TRUE,
  max.rows = NULL,
  ...
)
```

**Arguments**

object	An object of class hsstan.
pars	Vector of parameter names to be extracted. If NULL (default) then this refers to the set of predictors used in the model.
prob	Width of the posterior intervals (0.95, by default).
digits	Number of decimal places to be reported (2 by default).
sort	Column name used to sort the results according to the absolute value of the column. If NULL (default) or the column name cannot be found, no sorting occurs.
decreasing	Whether the results should be sorted in decreasing order when a valid column name is specified in sort (TRUE by default).
max.rows	Maximum number of rows to be returned. If NULL (default) or 0, all results are returned.
...	Currently ignored.

**Value**

A matrix with summaries from the posterior distribution of the parameters of interest.

**Examples**

```
# continued from ?hsstan  
summary(hs.biom)
```
